No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                              656

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                     ........HSSDFEKFSQKVLVSYISLV 126

/clone sold trees harvested every two weeks between from 5 year old trees harvested every two weeks between April and October of 2002 at the University of British Columbia south campus from each in Vancouver, British Columbia.
/clone agual quantities of mRNA from each tissue were then pooled. cDNA was prepared from 5 micrograms of mNA and directionally ligated into the pBluescript II SK (+) XR vector using the pBluescript II XR cDNA Library Construction Kit according to manufacturer's instructions with modifications (Stratagene). Plasmid DNA was then transformed by electroporation into DH10B cells
/construction to published methods [Bonaldo M.F. et al. (1996) Genome Research 6 (9):791] in order to reduce the abundance of highly expressed transcripts."
                                                                                                                                                                                                                                                                                                                                                                                                                                                             Populus trichocarpa (Spring Area) (Streptophyta; Embryophyta; Tracheophyta; Bukaryota; Viridiplantae; Streptophyta; Embryophyta; Tracheophyta; Eubryophyta; Malpighiales; Salicaceas; Saliceae; Populus. 1 (bases 1 to 624)

/note="Vector: pBlueecript II SK (+) XR; Site 1: EcoRI (5')
end of cDNA); Site_2: AhoI (3') end of cDNA); Outer xylem
from 5 year cold trees harvested every two weeks between
April and October of 2002 at the University of British
Columbia south campus farm in Vancouver, British Columbia.
mRNA was isolated from each tissue source independently
and equal quantities of mRNA from each tissue were then
pooled. cDNA was prepared from 5 micrograms of mRNA and
directionally ligated into the pBluescript II SK (+) XR
vector using the pBluescript II XR cDNA Library
Construction Kit according to manufacturer's instructions
with modifications (Stratagene). Plasmid DNA was then
transformed by electroporation into DHIOB cells
(Invitrogen) for propagation. Normalization was applied
according to published methods [Bonaldo M.F. et al. (1996)
Genome Research 6(9):791] in order to reduce the abundance
of highly expressed transcripte."

/note="Vector: pBluescript II SK (+); Site l: XhOI;
Site_2: EccRI; Total RNA was extracted from freeze dried
leaf tissue, using the method described by Wang and Vodkin
(Plant Molecular Biology Reporter 12:132-145, 1994).
POly/Ah = MRNA was isolated from total RNA wasing the
PolyAtract mRNA was isolated from total RNA wasing the
PolyAtract mRNA lablation system III (Promega). The
Ilbrary was prepared using the Stratagene pBluescript II
XR CDNA library construction kit. Complementary DNA was
synthesized from mRNA using a Poly (dT) sequence with a
XROI restriction site. EcoRI adapters were ligated to the
blunt ended cDNA fragments followed by restriction with
XhoI. The CDNA insert is protected from XhoI digestion via
methylation during first strand cDNA synthesis. The cDNA
fragments were directionally cloned into the EcoRI-XhoI
restriction site of the pBluescript vector. The ligated
CDNA fragments were transformed into E. coli ElectroMax
DH10B host cells. Transformation efficiency: 1.0E+04
Average insert Size by PCR: 1290 bp"

beforeamplification was 1.1x10°6 cfu (colony forming units). The background of empty clones was less than 1%. Inserts ranged from 0.5kb to 3 kb, as determined by PCR. Purified plasmid DNA from the primary library was converted to single-strandedcircles and used as a template for PCR amplification using the T7 and T3 priming sites flanking the cloned cDNA inserts. The purified PCR products, representing the entire cloned cDNA population, were used as a driver for normalization. Hybridization between the single-stranded library and the PCR products was carried out for 44 hours at 30C. Unhybridized single-stranded DNA circles were separated from hybridized DNA rendered partially double-stranded and electroporated into DNIOB cells to generate the normalized library. The total number of clones with insert was 9x10°6 cfu. Background of empty clones was less than 1%."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Bukaryota; Viridiplantae; Streptophyta; Embryophyta; Tracheophyta; Spermatophyta; Wagnollophyta; eudicotyledons; core eudicotyledons; rosids; eurosids II; Brassicales; Brassicaceae; Arabidopsis.

/lote="Organ: Phloem; Vector: pBluescript II SK (+) XR;
Site 1: Econ: Phloem; Vector: pBluescript II SK (+) XR;
Site 1: Econ: Glad of cDNA); Site 2: XhoI (3' end of cDNA); mANA was isolated from each tissue were then pooled. cDNA was prepared from each
tissue were then pooled. cDNA was prepared from 5
micrograms of mRNA and directionally ligated into the
pBluescript II SK (+) XR vector using the pBluescript II
XR cDNA Library Construction Kit according to
manufacturer's instructions with modifications
(Strategene). Plasmid DNA then was transformed by
electroporation into DH10B cells (Invitrogen) for
propagation. Normalization was applied according to
published methods [Bonaldo M.F. et al. (1996) Genome
Research 6(9):791 in order to reduce the abundance of the
highly expressed transcripts."

/clone_lib="PtxD-IL-N-A-9"
/clone_lib="VetCor: pBlueccript II SK (+) XR; Site 1: EccRI (5'
end of cDNA); Site 2: Xhol (3' end of cDNA); Sapling trees
two metres in height and grown under greenhouse conditions
were exposed to continuous feeding by Malacosoma disstria
Hubner (forest tent caterpillar) mid-instar larvae caged
on the sapling using mesh bags. Mature leaves from within
the caged region were collected 2 hours, 12 hours, 24
hours and 48 hours after the onest of treatment. mRNA was
isolated from each tissue source independently and equal
quantities of mRNA from each tissue were then pooled. cDNA
was prepared from 5 micrograms of mRNA and directionally
ligated into the pBluescript II SK (+) XR vector using the
pBluescript II XR cDNA Library Construction Kit according
to mannifacturer's instructions with modifications
(Stratagene). Plasmid DNA was then transformed by
electroporation into DH10B cells (Invitrogen) for
propagation. Normalization was applied according to
published methods (Bonaldo M.F. et al. (1996) Genome
Research 6(9):791] in order to reduce the abundance of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DR559298 906 bp mRNA linear EST 08-JUL-2005 WS02616.B21_G18 WS-PP-N-A-12 Picea glauca cDNA clone WS02616_G18 3, mRNA sequence.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Description

New transgenic plants for producing commercially or agriculturally useful plants having improved tolerance to drought, shade and low nitrogen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention relates to a novel plant transcription factor polypeptides, the DNA sequences which encode them and their use in creating transgenic plants. The transgenic plant and methods are useful for producing commercially or agriculturally useful plants having improved tolerance to drought, shade and low nitrogen conditions when compared to wild-type reference plants. The present sequence is that of a plant transcription factor gene which was used during the development of the transgenic plants of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 GluhrgAlaLeuAlaValTyrAspLysAspThrProAspArgTrpHisAsnValAlaLys 40

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       8
                                                                                                                                                                                                                                                                The invention relates to a transgenic plant that possesses a plant transformation vector comprising a nucleotide sequence that encodes a peronospora parasitica resistant (PPR2) protein, or a PPR2 orthologue. The transgenic plant is useful in generating plants with a pathogen resistance phenotype. The PPR2 nucleic acids and proteins of the invention are useful in the generation of genetically modified plants having a modified pathogen resistance phenotype. The present DNA sequence encodes an Arabidopsis thaliana PPR2 protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            TCAAGAAGCATCAATGACTTTGACACAAGGTATATAACTAAATATCTATATATGATGCTC 300

The invention relates to a recombinant polynucleotide comprising any of the 58798 Cotton plant cDNA sequences mentioned in the specification.

Also a recombinant polypaptide comprising any of the 58798 amino acid sequences mentioned in the specification and producing a plant having an improved property.

Comprises transforming a plant with a recombinant construct comprising a promoter region functional in a plant cell operably joined to a promoter region functional in a plant cell operably joined to a promoterty, and growing the transformed plant. The polypeptide associated with the property, and growing the transformed plant. The polypeptide is cusful for improving plant cold tolerance, manipulating growth rate in plant tolerance, providing increased resistance to plant disease, concounting galactomannan (or lignin or plant growth regulators), improving plant tolerance, improving plant tolerance to herbicides, increasing conducing galactomannan (or lignin or plant growth regulators), improving plant tolerance conditions or plant growth regulators), improving plant tolerance conditions or to pathogens or pests, improving yield by modification of photosynthesis, modifying seed oil or protein yield by modification of photosynthesis, modifying seed oil or protein yield cor phosphorus use and/or uptake, or improving yield by providing improved plant growth and development under at least one stress condition. The constructs, in physical arrays of molecules, as plant breeding markers, or in computer-based storage and analysis systems. The sequence constructs are not to be invent and development with a property of the constructs. The sequence constructs are not to be invention or this constructs. The sequence constructs are not to be invention or the constructs of the construct of the construct of the construct of the construct of the construct of the construct of the construct of the construct of the construct of the construct of the construct of the construct of the construct of the construct of the construct of the

New recombinant DNA construct, useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for conferring increased resistance to plant disease, or for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention describes a recombinant DNA construct comprising a polynucleotide consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent office at ftp.seqdata.uspto.gov/sequence.html?DocID:2004034888. The polynucleotide of the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for manipulating growth rate in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         14-JUL-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             02-JUL-1999
  Increased resistance to plant disease, for producing galactomannan, lightin or plant growth regulators, for increasing the rate of homologous recombination in plants, for improving yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one stress condition or for modifying seed oil or protein yield and/or content. This sequence represents a plant full length insert polymucleotide that can be used in the recombinant DNA construct of the
                                                                                                                                                                                                                                                                                                                          9

The homologus or related genes, for producing compositions that modulate the capression or related genes, for producing compositions that modulate the capression or function of the polypeptides, for mapping functional regions of the protein, in diagnosis, for studying associated physways, for genetic manipulation of cells, preferably plant cells, in screening assays of various plant strains to determine the strains that are capable of withstanding a particular disease or the strains that are capable of withstanding a particular disease or conversationmental stress, for enhancing or inhibiting production of plosynthetic products in plants and to create genetically modified and transgenic organisms, such as plant cells and plants. Transgenic plants are useful for introducing or improving diseases resistance and stress colerance in plants, screening biologically active agents, such as cungicides and insecticides, and for elucidating biochemical pathways. Sequences ABX56649-ABX57647 represent Arabidopsis thaliana sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from USPTO at sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel Arabidopsis thaliana nucleic acid useful for identifying homologous or related genes, and to create genetically modified and transgenic organisms, such as plant cells and plants.
                                                                                                                                                                                                                                                                                                                                                                                                                         Price JL, Raines TM, Yu Y;

(first entry)

```
The invention relates to a number of isolated Arabidopsis thaliana CDNA sequences and their encoded proteins which are especially transcription factor related cDNA's and proteins. The isolated or recombinant plant transcription factor polynucleotides and polypeptides are useful in producing transgenic plants with commercially valuable properties, i.e. modified or altered desirable traits as compared to a reference plant, such as an alteration in a plant growth characteristic, e.g. growth rate, germination rate of seeds, vigor of plants and seedlings, or leaf and flower senescence. Sequence information related to the polynucleotides and polypeptides can also be used in bioinformatic search methods. The transgenic plant is useful for growing a progeny plant from a parent plant. This sequence represents one of the CDNAs of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New plant transcription factor polynucleotides and polypeptides, useful in producing transgenic plants with commercially valuable properties, such as an alteration in a plant growth characteristic, e.g. growth rate

The invention describes a transgenic plant comprising a recombinant polynucleotide of any one of more than 500 nucleotide sequences fully defined in the specification or its complement. The method of the invention can be used to produced a plant having altered traits such as: can be used to produced a plant having altered traits such as: can be used to produced a plant having altered traits such as: can be used to biotic stress; glyphosphate tolerance; hormone structure, change in stem bifurcations, altered branching pattern, reduced apical dominance, reduced trichome density; lack of trichomes; reduced ectopic trichome development; altered trichome trichome component; increased from morphology; increased took growth; increased nroot hairs; altered seed development; altered cell proliferation or cell differentiation; rapid development; premature sensecence; increased necrosis; increase in seedling or plant size; decreased plant size; leaf morphology; seed contocyanins, or alteration in light response or shade avoidance. The transgenic plant, polynucleotides and polypeptides are useful in bioinformatic search methods. This sequence represents a plant bioinformatic search methods this sequence represents a plant bionformatic search methods. This sequence represents a plant bionformatic search methods this sequence represents a plant bionformatic search method this sequence represents a plant bioner related polynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          167

This invention relates to novel isolated plant nucleic acid molecules, or variants thereof, that encode transcription factors. Specifically, it refers to transcription factor proteins that are capable of binding to DNA in order to regulate gene transcription and gene expression in a plants, in particular Eucalyptus grandis and Pinus radiata. The present convention describes DNA constructs containing DNA encoding a transcription factor that regulates the promoter, which is operably transcription factor that regulates the promoter, which is operably transgenic plants expressing a transcription factor that confers a trait to the plant such as increased drought, salt or disease tolerance, height contritional characteristics, as well as improved taste, starch contrition, flower longevity and germination, amongst others.

CC composition, flower longevity and germination, amongst others.

CC composition, the delaracterized by a difference in flower color, petal or leaf shape and size, aroma or plant height. This polynucleotide is a construct can be characterized by a difference in flower color, petal or color plant transcription factor cDNA sequence of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention relates to a novel plant transcription factor polypeptides, the DNA sequences which encode them and their use in creating transgenic plants. The transgenic plant and methods are useful for producing commercially or agriculturally useful plants having improved tolerance to drought, shade and low nitrogen conditions when compared to wild-type reference plants. The present sequence is that of a plant transcription factor gene which was used during the development of the transgenic plants of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     19 MetPheGluArgAlaLeuAlaValTyrAspLysAspThrProAspArgTrpHisAsnVal 38

The invention transce to param interscent sequences that untert seed., constitutive transcription of an operatively linked nucleic seid of constitutive transcription of an operatively linked nucleic acid of constitutive transcription of an operatively linked nucleic acid of constitutive transcription also relates to a method for augmenting a plant constitution and method of identifying agene, where its expression is cancer in the seed, leaf, stem, panicle, pollen, root or is constitutive cancer. The plant is a cereal, e.g. soybean, alfalfa, sunflower, cancer, cotton, peanut, tobacco or sugar beet, preferably maize, barley, company, rote or wheat. The polymucleotides and the polypeptides they encode are useful for manipulating crop plants to alter or improve concode are useful for manipulating crop plants to alter or improve concode are useful for manipulating crop plants to alter or improve concode are useful for manipulating crop plants to alter or improve concode are useful for manipulating crop plants to answer the plants are proteins, to incur series tolerance (e.g. salt, cold or drought) to ensure the plants concode and high nutritional value with reduced apical dominance or dwarfism, early flowering or altered metabolic pathways. This sequence apresents a plant nucleic acid of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in the constant of the printed specification but was obtained in the constant of the printed specification but sequence thuml.
                                                                                                                                                                                                                                                                                                                                                               New rice promoter, useful for manipulating crop plants to alter or improve phenotypic characteristics, e.g. produce large quantities of oil or proteins, resistance to insecticides, virus or fungi, stress tolerance or high nutritional value.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     invention relates to plant nucleotide sequences that direct seed-

FEATURES

```
crouse were identified by a combination of several methods: Gene prediction programs including Genscan+ (Chris Burge, http://CCR-081.mt.edu/GENSCAN.html), GeneMarkHmM (Mark Borodovsky, http://genemark.biology.gatech.edu/GeneMark/), GlimmerA (a variant of GlimmerM, see Mihaela Pertea, mand Steven Salzberg, contact http://www.iigr.org/softlab/glimmerM.htm/glimmerm.html, and GeneSplicer (Mihaela Pertea and Steven Salzberg, contact mpertea@tigr.org), searches of the complete sequence against a peptide database and the plant EST database at TiGR (http://www.tigr.org/tdb/tgi.shtml). Annotated genes are named indicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits. Genes without significant peptide similarity but with EST similarity are named as unknown proteins. Genes without protein or EST similarity, the database hits. Genes without significant peptide similarity but with EST similarity, are named as unknown proteins. Genes without protein or EST similarity, the tare predicted by more than two gene prediction programs over most of their length are annotated as hypothetical proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, http://genome.washington.edu/RM/RepeatMasker.html).

Simple repeats are identified by repeatmasker (Arian Smit, http://ftp.genome.washington.edu/RM/RepeatMasker.html).

An Arabidopsis full-length cDNA library was constructed essentially

as reported previously (Seki et al. (1998) Plant J. 15:707-720;

Seki et al. (2002) Science 296:141-145; cDNA clasved with BamHI

and XhoI was ligated to modified Lambda FLC-1-E vector (Carninci et

This clone is in a modified pBluescript vector.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sec
                                                                                                                                                                                                                                                                                               CDS
                                                                                                                                                                                              Direct Submission

Burset Submission

Burset Submission

Submitted (27-FEB-2002) The Institute for Genomic Research, 9712

Medical Center Dr. Rockville, MD 20850, USA, cdtcwm@tigr.org

On Apr 18, 2002 this sequence version replaced gi:659868.

Sequencing, analysis, and annotation were performed within the
CSHL/WUGSC/ABI Arabidopsis Genome Sequencing Consortium.

Information on physical mapping and YAC and BAC library

construction as well as added annotation can be viewed at

http://www.cshl.org/arabweb/. We used GenScan, Grail, and MZEF for

predicting coding exons and assembling genes. BAC F6F23 maps to

YAC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /codon_start=1
